1.0 SCOPE OF WORK

The Scope of work consists of topographic survey of 1km length per ROB in approaches with a corridor of 100 m and, spot leveling, pillar fixing, processing of data to generate plan and Longitudinal section as per specified scale and details of the site.

For development of key plan and GAD, topographic survey of 1Km x 100m corridor will be carried out by using total station and precise levels along the entire alignment as per concept plan (covering railway and approach portion). Buildings, road, footpath/dividers/central verges, railway tracks, Railway OHE poles, trees, manholes and other structures, H.T., L.T., transmission lines, bridges, ROB's / RUBs, ponds, streams, major drains, level crossing, religious structures and other relevant site features shall be picked up during topographical survey. At some places, instrument having reflectorless facilities may be used for collecting details of features due to inaccessibility of the area. All the buildings falling in the 100 m corridor will be closed during the survey and shall be included in the drawings.

1.1 FIELD WORK

1.1.1 TOPOGRAPHIC PLANS & CROSS SECTIONS

The activity involves topographic / corridor survey of 100m corridor on both end approaches. Data to be collected includes recording x, y, z of existing features & taking spot levels of points not spaced more than 20m on both directions to be used for design of alignment.

1.1.2 PILLAR FIXING ON CONTROL POINTS

The positions of control points shall be established in the form of concrete pillars (Mix 1:2:4) of size 150x150x600mm, 450mm embedded in ground and 150 mm projecting above the ground. The pillar shall be painted yellow and duly marked for identification with black paint. The position of pillars shall be shown in the topographic plan and duly showing co-ordinates and level w.r.t. SOI bench mark in tabular form.

1.2 DRAWINGS : TOPOGRAPHIC PLAN & L- SECTION of ROB alignment

To develop the Plan and Sections of the proposed area on the following scale duly showing the ground level and duly depicting nature of terrain along with chain ages of change points along the section with adherence to the accuracy limits as specified.

Horizontal = 1:1000
Vertical = 1:100

A soft and hard copy of topographic plan with sections in Autocad 2014 format of the area duly plotting the surveyed features shall be submitted.

1.3 ACCURACY STANDARDS FOR TOPOGRAPHIC SURVEY

Special Conditions and Specifications

FOR

GEOTECHNICAL INVESTIGATION

I. Field Investigation - in SOIL

Boreholes shall be drilled at specified locations to obtain information about the sub soil profile, its nature and strength and to collect soil samples for strata identification and conducting laboratory tests. The minimum diameter of the borehole shall be 150 mm and boring shall be carried out in accordance with the provisions of IS: 1892. The depth of the individual borehole shall be restricted to 40m.

a) Standard Penetration Test

SPT shall be conducted by standard spilt spoon sampler at every 3.0m interval starting from first sample at 1.5m depth or at the change of stratum as per IS: 2131. The test shall be performed by driving the sampler with 63.5 kg hammer falling through a free fall height of 75cm. Number of blows shall be recorded for every 15cm penetration down to a maximum depth of 45 cm. Number of blows required to penetrate the last 30cm is taken as SPT 'N' value. On extracting the sampler, soil entrapped in the sampler shall be taken and representative soil sample shall be preserved as disturbed sample in polythene bags to prevent loss of fines.

b) Collection of Undisturbed Sample

Undisturbed soil sample shall be collected from clayey/sandy/silty strata at 3.0m intervals starting the first sample at 3.0m depth in 100 mm diameter thin walled steel samplers of about 50 cm length with built in tapered cutting edge at the driving end. These tubes shall be pushed at the bottom of the borehole by hammering, penetration being restricted to 45 cm. on extracting the sampler loose material shall be removed from the other end of cutting edge and then sealed with paraffin wax to avoid loss of moisture. Sample tubes shall be transported to laboratory for testing.

II. Field Investigation - in Rock

a) Core drilling shall be done by diamond core drilling machine using diamond bit. The feed or thrust to the drilling bit shall be actuated by hydraulic RIG. The equipment or set up shall be capable of recovering at least 75% of the drilled volume. The diamond core drilling equipment and procedure for drilling shall conform to IS: 6926. The equipment shall be provided with necessary facilities to regulate the spindle speed, bit pressure and water pressure during core drilling to get good core recovery.

b) Drilling shall be carried out with NX size diamond tipped drill bits or impregnated diamond bit depending on the type of rock encountered. Double tube swivel core barrel conforming to IS: 6926 shall be used to ensure good core recovery and to pick up cores from the layers of rocks. Suitable core catches shall be used to ensure continuous and good core recovery.

c) In general, the drilling run shall be of 1.5 m length, however this can be increased to 3.0m provided the core recovery is observed more than 80% in two successive 1.5m drill run. In boulder strata and highly weathered/jointed rocky strata having core recovery less than 20%, SPT shall be conducted in vertical boreholes at an interval of 3m or wherever there is change in strata.

d) The depth of borehole, wherever rock is encountered shall be restricted to 40m or 5m in fresh and hard rock, whichever is earlier.

III. Laboratory Testing

Routine laboratory testing on soil/rock samples shall be carried out. Type & no.of tests will depend on availability of samples and shall be decided by GT experts/Consultants.

a) Types of tests on Undisturbed/Disturbed Samples of soil will be out of :

- i. Visual and Engineering Classification.
- ii. Sieve Analysis and Hydrometer Analysis.
- iii. Liquid Limit, plastic limit, and Plasticity Index.
- iv. Specific Gravity.
- v. Bulk Density and Moisture Content.
- vi. Unconfined Compressive Test on selected samples.
- vii. Box shear test (In case of cohesion less soil) on selected samples.
- viii. Consolidation test on selected samples.
- ix. Triaxial shear test (U.U)

b) Type of test on selected Rock Samples will be out of :-

- i. Specific Gravity
- ii. Unconfined Compressive strength test
- iii. Porosity, moisture content and water absorption test.

IV. REPORT TO BE SUBMITTED:

After completion of the Geotechnical Investigationwork, the Consultant shall submit the results of tests on various samples of each bore hole in a proper tabular form as per relevant IS codes along with his detailed Report in six copies.

Geotechnical report shall cover the geology and seismicity of area, details of lab test results, borelog details. Based upon field and lab results, the Consultant will work out two options i.e. pile as well open foundation. For open foundation, net allowable bearing capacity will be worked out based upon bearing pressure and settlement criteria. For pile foundations, safe design load carrying capacity and safe uplift capacity of pile foundation will be worked out. Based upon the test details and site conditions, type of foundation will be worked out by the Consultant. Justification for adoption of pile foundation will be part of Geotechnical report.

V. MISCELLANEOUS:

If the Consultant does not have facility of any of the laboratory tests indicated herein he is at liberty to get the testing done at any outside laboratory of repute at his own expense. In such a case however the Consultant must explicitly state as to space where he intends to get the samples tested and have the prior approval of the Engineer.
